Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

- 1. (Currently Amended) A method for detecting drive anomalies, comprising:
- verifying data is written to a media upon an occurrence of a write operation, said write operation including a data persistency verification;
- (b) performing a data block integrity test by reading data from a single drive during an occurrence of a read operation; and
- (c) performing a location check by reading data from said single drive during said occurrence of said read operation, whereby retrieval of correct data from a correct physical location is ensured. wherein a data persistency verification is not performed during said read operation.
- 2. (Original) The method as claimed in claim 1, wherein said data persistency verification determines whether data is written to said media.
- 3. (Original) The method as claimed in claim 1, wherein a random read performance is increased by removing the requirement of reading a form of metadata from a second drive.
- 4. (Original) The method as claimed in claim 1, wherein said data block integrity test ensures that data has been retrieved properly.
- 5. (Currently Amended) The method as claimed in claim 1, wherein said location check ensures that data has been retrieved from the [[a]] correct physical location.

- 6. (Original) A method for detecting drive anomalies, comprising:
- verifying data is written to a media upon an occurrence of a write operation, said write operation including a data persistency verification;
- (b) performing a data block integrity test by reading data from a single drive during an occurrence of a read operation; said data block integrity test employing a parity error detection algorithm; and
- (c) performing a location check by reading data from said single drive during said occurrence of said read operation, said location check including the comparison of a location tag with an expected value, whereby retrieval of correct data from a correct physical location is ensured. wherein a data persistency verification is not performed during said read operation.
- 7. (Original) The method as claimed in claim 6, wherein said data persistency verification determines whether data is written to said media.
- 8. (Original) The method as claimed in claim 6, wherein a random read performance is increased by removing the requirement of reading a form of metadata from a second drive.
- 9. (Original) The method as claimed in claim 6, wherein said data block integrity test ensures that data has been retrieved properly.
- 10. (Currently Amended) The method as claimed in claim 6, wherein said location check ensures that data has been retrieved from the [[a]] correct physical location.
- 11. (Original) The method as claimed in claim 6, wherein said parity error detection algorithm is a cyclic redundancy check.

- 12. (Currently Amended) A method of detecting drive anomalies during a read operation, comprising:
- (a) reading data from a single drive into a cache memory;
- (b) generating a first parity error information set for a data read from said <u>single</u> drive;
- (c) comparing a second parity error information set with said first parity error information set; and
- (d) comparing a location tag with an expected value, wherein a data integrity test and location check is performed by reading data from said single drive.
- 13. (Original) The method as claimed in claim 12, wherein data has been retrieved correctly from said single drive when said first parity error information set matches said second parity information set.
- 14. (Original) The method as claimed in claim 13, wherein said second parity error information set is stored as metadata.
- 15. (Original) The method as claimed in claim 13, wherein said first parity error information set and said second parity error information set are cyclic redundancy check information.
- 16. (Original) The method as claimed in claim 12, wherein data has been retrieved from a correct physical location when said location tag matches said expected value.
- 17. (Original) The method as claimed in claim 16, wherein said location tag provides an indication of an address range associated with a data block.

6

Appl. No. 10/085,929 Reply to Office action of November 3, 2004

18. (Original) The method as claimed in claim 17, wherein a range of said address range is flexible.
